

BO Information-Selection Formula

Evidence-weighted discovery ranking and build-readiness rule

1. Rank each unresolved information requirement

$$R(r) = P(r) + 30 \mathbf{1}[C_r \cap A \neq \emptyset] + 10|E_r|$$

$$P(r) = \begin{cases} 300, & \text{if } r \text{ is critical,} \\ 200, & \text{if } r \text{ is high priority,} \\ 100, & \text{if } r \text{ is medium priority.} \end{cases}$$

r	An unresolved operating-information requirement.
C_r	Capabilities whose inclusion or design depends on requirement r .
A	Capabilities currently active in the proposed Command Center.
E_r	Matching evidence already found in the conversation.
$\mathbf{1}[\cdot]$	Indicator function: 1 when the condition is true, otherwise 0.

2. Select the highest-value unresolved requirement

$$r^* = \arg \max_{r \in U} R(r)$$

where U is the set of unresolved requirements. BO converts r^* into one short natural-language question.

3. Stop discovery only when the build is ready

$$\text{Ready} = (|U_{\text{critical}}| = 0) \wedge \left(\frac{\sum_{d \in D_{\text{resolved}}} w_d}{\sum_{d \in D} w_d} \geq 0.35 \right)$$

The dimension weights are

$$\begin{aligned} w_{\text{offering}} &= 5, & w_{\text{revenue}} &= 4.5, & w_{\text{delivery}} &= 4, & w_{\text{customer}} &= 3.5, \\ w_{\text{workforce}} &= 3, & w_{\text{supply}} &= 2.5, & w_{\text{control}} &= 2. \end{aligned}$$
